

ONA Landscaping LLC

We have always utilized natural principles in our landscaping style; however, we have realized how important it is to take a step even further. It's time to change our ways to strive for an even more natural approach.

This is why we are going 100% towards an earth friendly approach that will conserve water and resources while providing a low maintenance and beautiful landscape that works and is good for people and nature.

We will minimize our impact by using the most efficient equipment, high quality materials, and innovative waste management. We will also avoid using pesticides, and employ water conservation techniques into all of our creations to reduce impacts to the environment, save precious resources, and reduce maintenance costs for our clients.

We want to change your mind set about what landscaping should be. Less than perfectly green lawns in summer are ok, since they typically do the same in winter. Minimizing gravel and bark areas means you don't have to spray chemicals to maintain them. Maximizing plantings, using lawn alternatives that require less mowing and care, and designing your property to become low maintenance while also creating habitat is a win-win for you and the environment. Conserving water, and keeping it on your property rather than not running down the sidewalk into a storm drain just makes sense.

These concepts will make a difference to you directly in terms of time and money, and change the paradigm on how best to create a beautiful place to live that supports, rather than harms, the environment.

It's time to make a stand, to pick a different path. We know we can't fix the entire world, but we hope you will partner with us to demonstrate it's possible to create beautiful living spaces that can be an example of a new way of thinking.

This is why we are and have always been Optimal Natural Arrangements Landscaping.
